

Please add new claims 8-10 for consideration.

*Ad Comel.*

--8. (New) A system for producing an output signal for display on a display device, said system including a blocking system for selectively blocking the display of said output signal, said blocking system comprising:

- a) means for generating a blocking signal for selectively blocking the display of said output signal;
- b) means for generating an override signal for temporarily overriding said blocking signal and thereby allow display of a restricted output signal; and
- c) means for resolving conflicts between and among multiple override signals, wherein when a first override instruction is in conflict with a second override instruction, said conflict resolving means selectively chooses between said first and second override as to which of said overrides will be active.--

--9. (New) The system as recited in claim 8 wherein said blocking signal blocks the display of said output signal based upon at least one of a rating of said output signal, cost limits for display of said output signal, and time limits for viewing said output signal.--

--10. (New) The system as recited in claim 9 wherein a supervisor selectively sets the conflict resolution means to resolve conflicts according to the most restrictive or least restrictive resolution.--
